

ProcessUnity Analytics Database

Perform Advanced Analysis with External Report Writers and Analytics Tools

ProcessUnity’s Analytics Database add-on allows customers to perform advanced analysis on risk, compliance and offer management data stored in ProcessUnity.

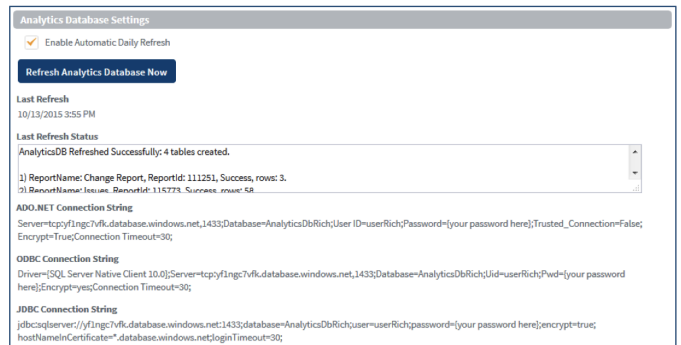

Built on Microsoft SQL Server technology, Analytics Database creates a direct, reliable and secure connection between ProcessUnity solutions and virtually any data warehouse system or external report writer – including Tableau, Crystal Reports, Cognos and more. Analytics Database requires minimal IT support for setup, making it easy to integrate ProcessUnity information into organizations’ existing analytics workflows.

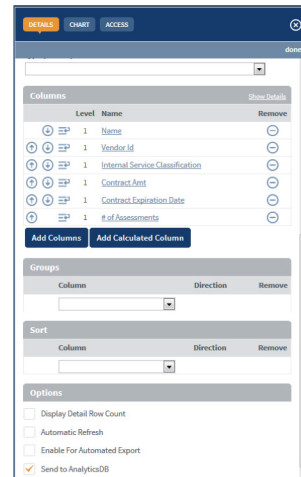

Create powerful data visualizations for risk, compliance and offer management program reporting.

Once deployed, a simple checkbox on any ProcessUnity custom report makes that data accessible in a cloud-based relational database. ProcessUnity automatically generates connection parameters for Analytics Database access from third-party tools and systems. Analytics Database supports both on-demand and daily data synchronization, so users always have access to up-to-date information.

Use the Analytics Database settings dialog to refresh data instantly or on a periodic basis. ProcessUnity automatically creates the connection parameters to access each database from the third-party application.

The simple “Add to AnalyticsDB” checkbox on a ProcessUnity custom report makes that data accessible to third-party analysis tools and report writers.
